NAME

mmap2 − map files or devices into memory

SYNOPSIS

#include <sys/mman.h>

void *mmap2(void *****addr*, **size_t** *length*, **int** *prot*,**
int *flags*, **int** *fd*, **off_t** *pgoffset*);**

DESCRIPTION

The **mmap2**() system call operates in exactly the same way as **mmap**(2), except that the final argument specifies the offset into the file in 4096-byte units (instead of bytes, as is done by **mmap**(2)). This enables applications that use a 32-bit *off_t* to map large files (up to 2^44 bytes).

RETURN VALUE

On success, **mmap2**() returns a pointer to the mapped area. On error −1 is returned and *errno* is set appropriately.

ERRORS

EFAULT

Problem with getting the data from userspace.

EINVAL

(Various platforms where the page size is not 4096 bytes.) *offset * 4096* is not a multiple of the system page size.

mmap2() can return any of the same errors as **mmap**(2).

VERSIONS

mmap2() is available since Linux 2.3.31.

CONFORMING TO

This system call is Linux-specific.

NOTES

Nowadays, the glibc **mmap**() wrapper function invokes this system call rather than the **mmap**(2) system call.

On ia64, the unit for *offset* is actually the system page size, rather than 4096 bytes.

SEE ALSO

getpagesize(2), **mmap**(2), **mremap**(2), **msync**(2), **shm_open**(3)

COLOPHON

This page is part of release 3.22 of the Linux *man-pages* project. A description of the project, and information about reporting bugs, can be found at http://www.kernel.org/doc/man-pages/.
