

NAME

`abrt-action-save-package-data.conf` – Configuration file for `abrt-action-save-package-data`

DESCRIPTION

The `abrt-action-save-package-data` tool queries RPM database and saves package and component name to problem data.

The configuration file consists of items in the format "Option = Value". A description of each item follows:

`OpenPGGCheck = yes | no`

When set to *yes*, *abrt* will handle only crashes in executables which belong to an installed package with valid GPG signature. The default is *yes*. The files containing trusted GPG keys which are used to verify the signatures are listed in the `gpg_keys` configuration file.

`BlackList = packageName, packageName ...`

abrt will ignore packages in this list and will not handle their crashes.

`BlackListedPaths = /path/to/ignore/*, */another/ignored/path* ...`

abrt will ignore crashes in executables whose absolute path matches one of specified patterns.

`ProcessUnpackaged = yes | no`

When set to *yes*, *abrt* will catch all crashes in the system. When set to *no*, it will catch crashes only in executables which belong to an installed package. The default is *no*.
