

NAME

`sigsuspend` – wait for a signal

SYNOPSIS

```
#include <signal.h>
```

```
int sigsuspend(const sigset_t *mask);
```

Feature Test Macro Requirements for glibc (see `feature_test_macros(7)`):

```
sigsuspend(): _POSIX_C_SOURCE >= 1 || _XOPEN_SOURCE || _POSIX_SOURCE
```

DESCRIPTION

sigsuspend() temporarily replaces the signal mask of the calling process with the mask given by *mask* and then suspends the process until delivery of a signal whose action is to invoke a signal handler or to terminate a process.

If the signal terminates the process, then **sigsuspend()** does not return. If the signal is caught, then **sigsuspend()** returns after the signal handler returns, and the signal mask is restored to the state before the call to **sigsuspend()**.

It is not possible to block **SIGKILL** or **SIGSTOP**; specifying these signals in *mask*, has no effect on the process's signal mask.

RETURN VALUE

sigsuspend() always returns `-1`, normally with the error **EINTR**.

ERRORS**EFAULT**

mask points to memory which is not a valid part of the process address space.

EINTR

The call was interrupted by a signal.

CONFORMING TO

POSIX.1-2001.

NOTES

Normally, **sigsuspend()** is used in conjunction with **sigprocmask(2)** in order to prevent delivery of a signal during the execution of a critical code section. The caller first blocks the signals with **sigprocmask(2)**. When the critical code has completed, the caller then waits for the signals by calling **sigsuspend()** with the signal mask that was returned by **sigprocmask(2)** (in the *oldset* argument).

See **sigsetops(3)** for details on manipulating signal sets.
