

NAME

`epoll_create`, `epoll_create1` – open an epoll file descriptor

SYNOPSIS

```
#include <sys/epoll.h>
```

```
int epoll_create(int size);
int epoll_create1(int flags);
```

DESCRIPTION

epoll_create() creates an epoll "instance", requesting the kernel to allocate an event backing store dimensioned for *size* descriptors. The *size* is not the maximum size of the backing store but just a hint to the kernel about how to dimension internal structures. (Nowadays, *size* is ignored; see NOTES below.)

epoll_create() returns a file descriptor referring to the new epoll instance. This file descriptor is used for all the subsequent calls to the **epoll** interface. When no longer required, the file descriptor returned by **epoll_create()** should be closed by using **close(2)**. When all file descriptors referring to an epoll instance have been closed, the kernel destroys the instance and releases the associated resources for re-use.

If *flags* is 0, then, other than the fact that the obsolete *size* argument is dropped, **epoll_create1()** is the same as **epoll_create()**. The following value can be included in *flags* to obtain different behavior:

EPOLL_CLOEXEC

Set the close-on-exec (**FD_CLOEXEC**) flag on the new file descriptor. See the description of the **O_CLOEXEC** flag in **open(2)** for reasons why this may be useful.

RETURN VALUE

On success, these system calls return a non-negative file descriptor. On error, `-1` is returned, and *errno* is set to indicate the error.

ERRORS**EINVAL**

size is not positive.

EINVAL

(**epoll_create1()**) Invalid value specified in *flags*.

EMFILE

The per-user limit on the number of epoll instances imposed by `/proc/sys/fs/epoll/max_user_instances` was encountered. See **epoll(7)** for further details.

ENFILE

The system limit on the total number of open files has been reached.

ENOMEM

There was insufficient memory to create the kernel object.

CONFORMING TO

epoll_create() is Linux-specific, and was introduced in kernel 2.5.44.

NOTES

Since Linux 2.6.8, the *size* argument is unused. (The kernel dynamically sizes the required data structures without needing this initial hint.)
